

Introducing Parker's IPS Product Guide

Updated Parker guide features structural framing products and systems.

Parker's Electromechanical Automation Division recently released a new catalog featuring its IPS brand of structural framing products and systems. The 232-page guide covers extrusion profiles, fasteners, brackets, handles, doors, panels, hinges, linear applications and more. Available as both a printed and electronic version, the revised catalog features new products, technical updates and clarification of units of measure. We've also removed or replaced obsolete products. "This new catalog is a more accurate representation of the current IPS product offering and capabilities," says Dave Bugajski, IPS product marketing manager.

IPS allows integration of other electromechanical products into fully integrated systems. Indeed, this catalog is complementary to the vast selection of motion control products that are presently being offered by the Parker Automation Group. From this core family of products, Parker's Electromechanical Automation Division can design a wide variety of plug-and-play bundled solutions to meet customer needs.

Printed on recycled paper, the IPS product catalog is part of Parker's green initiative, which seeks to reduce waste and ensure a sustainable future for our planet. Other projects in this effort include special Parker products for applications in the energy industries, such as solar scribing, hybrid vehicles and an electric scooter.

To order your copy of the newly revised IPS catalog, please visit parkermotion.com/literature or call 800-358-9070.

Of course, you can also download the PDF version by visiting parkermotion.com/ips.
