

Getting in Gear

Parker's new flange-face gearhead now a standard option.

Our flange-face gearhead is now offered as a standard on our PX and RX Stealth gearheads. It's mounted directly to the gearhead's rotating shaft without the use of any intermediate device. This feature offers a number of advantages, including:

- Allows a customer to directly mount to the gearhead's rotating shaft without the use of any intermediate device such as a coupling.
- Improves the torsional rigidity of the system, which in turn allows for easier tuning of the servo and improved dynamic response
- Overall envelope size of the assembly is reduced by this type of mounting configuration.
