

Parker Coming to Pack Expo

Parker's packaging solutions will be on display in Chicago, Oct. 28-31.

There's no question that Pack Expo is the leading trade show in the packaging industry. Front and center this year will be products and solutions offered by Parker Hannifin, including human-machine interface (HMI), servo drives with Ethernet-based motion bus, machine control with Ethernet-based motion bus, high-bandwidth servo motors, linear actuators, and high-bandwidth linear servo motors.

Parker's application and product solutions can help streamline food and beverage processing, resulting in reduced downtime, increased throughput, and lower maintenance costs. From motion and control products to food and potable water approved fittings, valves, tubing and couplings, we offer easy to install, highly reliable solutions for the most demanding standards and specifications. Selectable levels of integration — which include components, modules, and integrated systems — lower development costs and speed time to market, while our food and beverage team can help with everything from IP69K to determining the most efficient and cost-effective hygienic processing solutions.

Among the products we'll be displaying this year:

AC, DC, and Servo Drives

Parker is an industry-leading manufacturer of AC variable speed drives, DC drives, and servo drives and motors. Our offering includes a comprehensive AC, DC, and servo product line through 2,000 HP. Parker AC drive products are easy to configure and commission, with simple but flexible function block-based configuration tools and connectivity with all major industrial fieldbus networks. With the same architecture as our AC drive products, Parker digital DC drives allow the user to integrate both AC and DC drive systems in a single machine with the same interface and software.

Electric Cylinders and Actuators

A complete range of ISO designed electric cylinders provides optimized solutions for your indexing or press to force needs. Electric cylinders range in force from 100 to 10,000 lbs. The Parker ETH series, for example, is the next generation version of the well-known, widely used ET series. The ETH design offers unrivaled power density due to larger screw and bearing designs in smaller packages. The result is a product that offers increased force output from a given frame size or increased product life at the same force output.

Visualization Products

The Parker Factory Display is part of Parker's "Information Anywhere" product family. This family of products is designed to turn your plant floor "data" into information and distribute it anywhere you want.

Operator Interfaces, HMI, Touchscreen Controls

Parker offers one of the best lines of industrial PCs, industrial monitors, and dedicated HMI product lines with unlimited tags and many free drivers. Learn more about the Parker "Information Anywhere" concept.

Whatever your packaging need, Parker is the only supplier that can provide complete technical and engineered solutions — from electromechanical and pneumatics to hoses, tubes and fittings — to any packaging requirement.

Parker also manufactures full systems for complete product compatibility and ease of use.
